

FOCUS TRADING ENGINE v2.0

24-Hour Simulation Audit, Quantitative Performance & Architecture Report

DATE: Sunday, September 13, 2026 | DATA SOURCE: SUPABASE LIVE DATABASE

1. EXECUTIVE PERFORMANCE SUMMARY

During the evaluated 24-hour testing window, the Focus Trading Engine executed 202 closed positions in simulated dry-run mode on Bitget USDT-Margined perpetual contracts. The bot achieved a win rate of 37.62% and experienced a net realized loss of -1.5015 USDT (a -15.0% drawdown on an initial \$10.00 virtual capital base). A critical finding of this audit is that exchange taker fees (-1.2119 USDT) accounted for 80.7% of the entire net loss, driven by hyperactive churning (average hold time of just 66 seconds per trade) and a hyper-tight hard stop loss (0.8% unleveraged move) that prematurely triggered on normal 1-minute altcoin market noise.

TOTAL TRADES 202 24h Execution Count	WIN RATE 37.62% 76W / 126L	NET REALIZED PNL -1.5015 USDT -15.0% on Capital	TOTAL FEES PAID 1.2119 USDT 80.7% of Total Loss
GROSS TRADING PNL -0.2896 USDT Before Exchange Fees	PROFIT FACTOR 0.78 Gross Win / Gross Loss	AVG WIN / LOSS +\$0.0702 / -\$0.0543 Reward:Risk = 1.29	AVG HOLD DURATION 1.1 Minutes Min: 0s Max: 10.8m

2. EXECUTION BREAKDOWN: EXITS & DIRECTIONAL BIAS

EXIT REASON DISTRIBUTION			DIRECTIONAL & COIN CONCENTRATION		
Reason	Trades	Realized PnL	Metric	Long Positions	Short Positions
MAX_LOSS	125 (61.9%)	-6.8010	Count / %	108 (53.5%)	94 (46.5%)
TAKE_PROFIT	76 (37.6%)	+5.3383	Win Rate	38.0%	37.2%
ATR_TRAILING_STOP	1 (0.5%)	-0.0388	Net PnL	-0.9895 USDT	-0.5120 USDT
* 61.9% of all trades terminated at MAX_LOSS hard stop due to 0.8% noise.			Heavy Loss Concentration: • LSKUSDT: 88 trades (43.5% of total) Net: -0.8047 USDT • CVCUSDT: 31 trades (15.3% of total) Net: -0.6030 USDT => These 2 coins accounted for 93.7% of all net losses!		

AUDIT HIGHLIGHT: 100% OF TRADES WERE TIER 2 WITH GROQ LLM APPROVAL

Every single trade (202 out of 202) was generated by the Tier 2 Momentum detector and approved by the Groq Cloud LLM (openai/gpt-oss-20b). Zero Tier 1 pullback trades triggered. The LLM had a 100% approval rate, meaning the AI acted as a rubber stamp rather than an adversarial risk filter.

TECHNICAL ARCHITECTURE

SYSTEM ARCHITECTURE & EXECUTION PIPELINE

The Focus Trading Engine v2.0 is a 24/7 cloud-native trading system operating on Bitget USDT perpetual futures. It continuously scans for momentum coins, streams sub-second ticks via WebSocket, evaluates multi-indicator quantitative signals, validates setups via a multi-key Groq Cloud LLM array, and manages positions with dynamic ATR stops.

DYNAMIC VOLATILITY SCANNER

1. Coin Selector (coin-selector.ts)

Scans all Bitget USDT-futures tickers every 30 minutes. Filters out TradFi stocks/commodities/forex. Computes a volatility score = $|24h\ \% \text{ Move}| \times \log_{10}(\text{Volume USDT})$. Picks the #1 highest-volatility coin and avoids re-picking the same symbol in consecutive cycles.

LOW-LATENCY WEBSOCKET

2. Streaming Data Ingestion (bitget-ws.ts)

Maintains persistent WebSocket connection to Bitget public market feeds. Bootstraps 60 x 1m candles and 40 x 5m candles via REST, then live-streams ticks and real-time candle closures. Broadcasts live metrics to Supabase telemetry.

MULTI-TIMEFRAME CONFLUENCE

3. Quantitative Signal Detector (signal-detector.ts & indicators.ts)

Computes technical indicators on each 1m candle close: EMA 9, EMA 21, EMA 50, RSI 14, ADX 14, Choppiness Index (CHOP), VWAP, MACD (12, 26, 9), ATR 14, and Volume Z-Score. Hierarchical 3-tier signal logic:

- Tier 1: Pullback in direction of 5m trend (Instant execution, bypasses LLM).

GROQ CLOUD MULTI-KEY ARRAY

4. AI Risk & Narrative Router (llm-router.ts & groq-client.ts)

Leverages an array of 7 Groq API keys with automatic round-robin rotation and HTTP 429 rate-limit failover. Runs openai/gpt-oss-20b or Llama 3 models. Evaluates the coin narrative and conducts a 4-block risk audit (Audit, Technical, Narrative, Macro) before giving a trade verdict.

HIGH-PRECISION EXIT MANAGER

5. Position Guardian (position-guardian.ts)

Independent WebSocket tick monitor dedicated to open positions. Evaluates exit criteria on EVERY live price tick:

- Hard Stop Loss: Triggered when $\text{return} \leq -4.0\%$ (0.8% unleveraged at 5x).
- Take Profit: Triggered when $\text{return} \geq +6.0\%$ (1.2% unleveraged at 5x).

POSTGRESQL + DASHBOARD

6. Telemetry, Database & Server (supabase-logger.ts & server.ts)

Persists all trades, signals, and telemetry to Supabase tables (futures_trades, market_signals, engine_status, virtual_wallet). Houses a lightweight HTTP server serving /health ping endpoints for Render uptime and hosting a Vite/React dark-mode analytics dashboard.

DATA & LOGIC EXECUTION PIPELINE

Bitget REST (Scanner) % % > Select Coin % % > Bitget WS (Candles & Ticks) % % > Quantitative Filter (1m + 5m MTF) % % > [PASS: Tier 1] % % > Groq LLM Rotation % % > Virtual Order % % > Position Guardian WS (Tick SL/TP/ATR)

ROOT CAUSE FAILURE ANALYSIS

Why did the bot fail to make a profit during the 24-hour simulation? Analysis of the 202 executed trades, trade durations, and exit logs reveals five fundamental structural and mathematical flaws:

[CRITICAL] FLAW 1: FEE DRAG ANNIHILATION (80.7% of Net Losses)

The bot completed 202 round-trip trades in 24 hours (~8.4 trades/hour). On Bitget, taker fees are 0.06% on entry and 0.06% on exit (0.12% total). With 5x leverage, every trade paid \$0.006 in fees on a \$1.00 margin. Over 202 trades, total fees reached 1.2119 USDT against a gross trading loss of only -0.2896 USDT. The bot was churning trades so rapidly that fee friction consumed 12% of the total account balance.

[CRITICAL] FLAW 2: STOP LOSS PLACED INSIDE NOISE BAND (0.8% Adverse Move)

The configuration defined `MAX_LOSS_PCT = 0.04` (4% leveraged). With `LEVERAGE = 5`, the unleveraged price stop was just 0.8% ($0.04 / 5 = 0.008$). On high-beta altcoins (LSK, CVC, STEEM), the natural 1-minute candle wick size and bid-ask spread is routinely 0.8% to 1.5%. Consequently, 125 out of 202 trades (61.9%) were stopped out almost instantly by market noise, leading to an average trade lifespan of just 66 seconds.

[HIGH] FLAW 3: GROQ LLM "RUBBER STAMPING" & LACK OF ADVERSARIAL SKEPTICISM

All 202 trades were classified as Tier 2 and routed to Groq Cloud LLM. The LLM approved 100% of the candidate signals submitted to it. The prompt instructed the LLM to verify narrative and technical risk, but the model acted as an uncritical confirmation echo-chamber. An AI risk filter must have a selective approval rate (e.g. 20–30% approval) to filter out marginal setups.

[HIGH] FLAW 4: COIN OVER-CONCENTRATION & RE-ENTRY CHURNING

The engine took 88 trades on LSKUSDT (-0.8047 USDT) and 31 trades on CVCUSDT (-0.6030 USDT). Together, these two coins generated 93.7% of all losses. When a trade was stopped out, the 2-minute cooldown would lapse, and because the coin was still volatile, the engine immediately re-entered the exact same choppy asset. There was no consecutive-loss circuit breaker.

[MEDIUM] FLAW 5: TIMEFRAME MISMATCH & TRAILING STOP BYPASS

The bot traded 1-minute momentum breakouts. 1-minute crypto breakouts have a notoriously high false-breakout rate. Furthermore, only 1 trade out of 202 ever exited via `ATR_TRAILING_STOP`. Because the hard stop was so tight, positions were terminated before they could ever develop sufficient profit to engage the trailing stop or breakeven mechanisms.

ACTIONABLE FIXES & AI ADVISORY PROMPT

1. TOP 5 ENGINEERING FIXES TO ACHIEVE PROFITABILITY

1. Widen Stop Loss to Structural ATR Levels (Min 1.5x - 2.5x ATR): Stop using a static 0.8% price move. Place stops below recent 5m swing lows/highs or 2x ATR (typically 1.5% - 3.0% unleveraged), reducing leverage to 2x or 3x so dollar risk per trade stays constant while giving trades breathing room.
2. Implement a Consecutive Loss Circuit Breaker: If an asset suffers 2 consecutive stop-outs in a row, block that coin from being selected or traded for at least 4 hours. This prevents the 88-trade churn on LSKUSDT.
3. Migrate Primary Decision Engine from 1m to 5m/15m Candles: 1-minute charts are dominated by HFT market-maker noise. Executing on 5m or 15m closed candles with a confirmed higher-timeframe trend will cut trade frequency by 80% and eliminate fee churn.
4. Overhaul Groq LLM Prompt with Strict Skepticism: Instruct the LLM that its primary job is capital protection. Force it to reject at least 70% of candidate setups by requiring strict criteria: no entry if RSI is extended (>65 for longs), no entry if volume is below 1.5 Z-score, and require explicit structural support.
5. Utilize Maker Post-Only Limit Orders: Shift from aggressive taker market orders to limit orders placed at key pullback levels (e.g. EMA 21 or VWAP retest). Maker orders earn fee discounts or rebates, completely eliminating the \$1.21 fee drag.

2. READY-TO-USE PROMPT FOR OTHER AI CONSULTANTS (Claude / DeepSeek / GPT-4o)

COPY & PASTE THIS PROMPT TO OTHER AI MODELS:

"I am sharing a 24-hour simulation performance audit and architecture of our algorithmic trading bot (Focus Trading Engine v2.0).
The bot runs on Bitget USDT Perpetual Futures with 5x leverage and a \$1.00 margin per trade. In 24 hours, it took 202 trades, won 37.62% (76W / 126L), and lost -1.5015 USDT.

Key Findings:

1. Fees accounted for 80.7% of total loss (-1.2119 USDT) due to hyper-churning (avg duration 66s).
2. 61.9% of trades exited at MAX_LOSS (-4.0% leveraged = 0.8% unleveraged move), getting stopped out by 1-minute candle noise.
3. 100% of trades were Tier 2 momentum breakouts approved by Groq LLM (100% approval rate, acting as an uncritical rubber stamp).
4. Heavy concentration: 88 trades on LSKUSDT and 31 on CVCUSDT accounted for 93.7% of all losses.
5. Primary timeframe is 1m with 5m confirmation.

Based on this data and the system architecture provided in this PDF:

1. What mathematical adjustments to Stop Loss, Take Profit, and ATR multipliers should we implement to ensure positive expectancy?
2. How should we restructure the Groq LLM prompt and scoring weights so it acts as an adversarial risk filter instead of approving everything?
3. What rule-based filters (e.g. volume thresholds, time-of-day, cooldowns, volatility regime) would effectively eliminate the churn on choppy coins like LSK and CVC?
4. Should we transition the primary timeframe to 5m or 15m, and how should entry execution be redesigned (e.g. limit orders at VWAP/EMA retests vs market breakouts)?"

COMPLETE 24-HOUR TRADE LOG (202 TRADES)

The following table lists all 202 simulated trades recorded in the Supabase futures_trades table over the last 24 hours in chronological order. Green represents winning positions; Red represents losing positions.

#	Time (UTC)	Symbol	Side	Entry (\$)	Exit (\$)	Return %	PnL (\$)	Fee (\$)	Dur.	Exit Reason
